JOURNAL OF THE NEW YORK ENTOMOLOGICAL SOCIETY, VOL. 4: DEVOTED TO ENTOMOLOGY IN GENERAL; 1896 (CLASSIC REPRINT)

Forgotten Books, United States, 2015. Paperback. Book Condition: New. 229 x 152 mm. Language: English . Brand New Book ***** Print on Demand *****.Excerpt from Journal of the New York Entomological Society, Vol. 4: Devoted to Entomology in General; 1896 Dorsal and lateral spaces broad, subventral space narrow, contracted. Ridges very slight, the subdorsal indicated only by the change in direction in the slope of the body, lateral and subventral ridges more distinct, approximate. The ancestral warts converted into fleshy horn-like processes, unequally elongated; in stage I bearing a few slender setae (Plate I, fig. 1); after the first molt, the subdorsal and lateral rows covered with numerous urticating spines, the subventral row rudimentary, represented by two weak setae. Of the subdorsal row, the horns on joints 3 to 5 and 11 to 13 are distinct, those on joints 6 to 10 rudimentary, but a seta is present even in the last stage. Of the lateral row, the one on joint 5 is absent. Depressed areas very feebly developed, only their glandular centers distinguishable as slight pits, partially free from skin spines; the dorsal row (1) consequently paired, the addorsal row(2) still slighter, only distinguishable on certain segments or at favorable times, such as just before a molt. Of the lateral rows, the lateral(4) and lower intersegmental lateral(6) can be made out as slight pits. No others visible. In the contracted subventral space, the two large rows(7 and 8) appear as faint glandular dots, nearly in line. Skin at first smooth, in the later stages finely spinulose. At the last molt, besides certain changes in color, the length of the horns is markedly reduced and their skin-spines shortened. Certain highly modified, easily detachable skin-spines appear, the shorter ones, designated caltropes by Dr. Packard, occur in patches at the ends of...
