It is essential for the description of degenerate ground states, massless modes, and topological defects. Examples are abundant in condensed matter physics, atomic and particle physics, as well as in astrophysics and cosmology. In fact, spontaneous symmetry breaking can be regarded as a cornerstone of a whole branch of physics which intersects the above mentioned traditionally distinct fields. In the year 2000 the European Science Foundation (ESF) started the Programme Cosmology in the Laboratory (COSLAB), with the goal to search for and to develop analogies between condensed matter physics, particle physics, and cosmology. Not surprisingly, spontaneous symmetry breaking is among the most useful notions in that endeavour. It has been decided that in the second year of the Programme a School should be held in order to work out and deliver to a wide audience of students synthetic overviews of achievements and of current research topics of COSLAB. This idea has been supported by the Scientific and Environmental Affairs Division of NATO by including the School in the renowned series of its Advanced Study Institutes. The...
